Surface Modification Engineering: Fundamental aspects, 1989 **Surface Engineering** R. Kossowsky, S.C. Singhal, 2012-12-06 Over the last few years there has been increasing need for systematically and strategically designed experiments of surface morphology evolution resulting from ion bombardment induced sputtering Although there is an impressive number of investigations 1 concerned with semiconductor materials as a result of immediate applications the most systematic investigations have been conducted with fcc metals with particular interest on single crystal Cu 2 3 Evidence now exists that within certain parameters i e ion species Ar ion energy 20 44 KeV substrate 2 temperature 80 550 K dose rate 100 500 $\mu\text{A cm}^{-2}$ residual x 5 9 pressure 5 10 to 5x10 mm Hg and polar and azimuthal angle of ion incidence 4 reproducible surface morphology etch pits and pyramids is achieved on the 11 3 1 specific crystallographic orientation The temporal development of individual surface features was also observed in this later study 4 by employing an in situ ion source in the scanning electron microscope at Salford a technique also employed in studies of the influence of polar angle of ion incidence 5 and surface contaminants 6 on the topography of Ar bombarded Si Studies have also been made on the variation of incident ion species with the 11 3 1 Cu surface and it was fully recognized 7 that residual surface contaminants when present could play a major role in dictating the morphological evolution
