Introduction to Analysis in One Variable Michael E. Taylor, 2020-08-11 This is a text for students who have had a three course calculus sequence and who are ready to explore the logical structure of analysis as the backbone of calculus It begins with a development of the real numbers building this system from more basic objects natural numbers integers rational numbers Cauchy sequences and it produces basic algebraic and metric properties of the real number line as propositions rather than axioms The text also makes use of the complex numbers and incorporates this into the development of differential and integral calculus For example it develops the theory of the exponential function for both real and complex arguments and it makes a geometrical study of the curve e^{xt} for real t leading to a self contained development of the trigonometric functions and to a derivation of the Euler identity that is very different from what one typically sees Further topics include metric spaces the Stone Weierstrass theorem and Fourier series
