Progress in Motor Control Dagmar Sternad,2008-12-25 It has become widely acknowledged and almost trivial to state that the study of the control and coordination of biological movement motor control is inherently multidisciplinary From the investigation of overt functional behavior to the intricacies of neuronal activations the issues are numerous and invite many different levels of analysis methods and perspectives Clearly the biological movement system is simultaneously a dynamical neurophysiological electrophysiological and intentional system in short a complex system in the technical sense of the word While multidisciplinary in motor control research is a necessity it also presents a stumbling block to developing a coherent body of knowledge that represents the science of the control and coordination of movement Research thrusts are developing from different academic backgrounds that are not easily understood by peers with entirely different disciplinary training Not only for the student of motor control but also for the advanced researcher it can be daunting to make connections for example between cognitive issues like planning or attention and functional properties of the peripheral nervous system between motor cortical activation and the biomechanics of the multi joint limb system Yet all of these approaches aim to shed light on the same phenomenon the astonishing ability of biological systems to move perceive grow adapt use tools and do infinitely more things For the science of motor control to progress more integration of disciplines is therefore necessary
