Statistics for Life Science 2 Ulf Olsson, 2011-11-01 *Statistics for Life Science* is a series of two books in statistics for students majoring in the life sciences The emphasis is on methods for drawing conclusions from biological data Most of the examples and exercises use real data from published research Analyses are illustrated with printouts from the SAS and Minitab packages Each chapter includes a number of exercises with solutions Supplementary material including solutions to many exercises using the R language is available at the books home page The book includes some advanced topics that are not normally included in introductory texts such as general linear models generalised linear models and mixed models for analysis of repeated measures data and a section on methods for clinical trials The book starts with chapters on simple and multiple linear regression The concept of general linear models including covariance analysis is introduced through the use of dummy variables General non linear regression models are discussed Methods for non normal data are covered in several chapters one chapter on non parametric methods one chapter on analysis of contingency tables and one chapter on generalised linear models Our treatment of the analysis of repeated measures data is based on the concept of mixed linear models A chapter on multivariate methods introduces methods such as principal component analysis factor analysis and cluster analysis Finally some topics relevant for clinical trials are discussed such as early stopping equivalence studies and dose finding studies The purpose of the book is to provide a rather comprehensive overview of statistical methods used in the
