integer linear optimization This theory is developed using two simple but unifying ideas projection and inverse projec tion Through projection we take a system of linear inequalities and replace some of the variables with additional linear inequalities Inverse projection the dual of this process involves replacing linear inequalities with additional variables Fundamental results such as weak and strong duality theorems of the alternative complementary slackness sensitivity analysis finite basis the orems etc are all explained using projection or inverse projection Indeed a unique feature of this book is that these fundamental results are developed and explained before the simplex and interior point algorithms are presented *Linear Integer Programming* Elias Munapo,Santosh Kumar,2021-12-06 This book presents the state of the art methods in Linear Integer Programming including some new algorithms and heuristic methods developed by the authors in recent years Topics as Characteristic equation CE application of CE to bi objective and multi objective problems Binary integer problems Mixed integer models Knapsack models Complexity reduction Feasible space reduction Random search Connected graph are also treated *An Introduction to Linear Programming and Game Theory* Paul R. Operations Management of Distributed Service Networks Niv Ahituv,Oded Berman,2012-12-06 Distributed service networks encompass various facilities with which we have daily contact In the public sector they include for instance ambulance fire and police services in the business sector they include maintenance and repair services road services courier services and the like Policy making problems in distributed service networks can be clearly classified into a number of hierarchical levels The levels are distinguished by the time horizon of the problem by the amount of cost involved in the implementation of a solution and by the political implications of the solution This top down classification is typical of what is known as the systems approach advocating that the direction of the analysis of complex systems should be from the whole to the details The top down classification consists of the following categories of policies 1 Zoning How should a network be partitioned into subzones 2 Station location Where should service stations or service units be located 3 Resource allocation What amount of resources should be allocated to the stations vii viii Preface 4 Dispatching routing and repositioning What is the optimal dis patching policy what are the optimal routes for nonbusy units and under what circumstances is it worthwhile to reposition a certain idle unit A top down approach implies that each of the problems is solved separately however the solution of a higher level problem sets constraints on problems at lower levels
