analysis This book explains this new endeavour to explore the augmentation of reduced dimensions in computer vision This book consists of three parts basic concepts techniques and applications The first part explains the basic concepts for understanding active illumination techniques In particular the basic concepts of optics are explained so that researchers and engineers outside the field can understand the later chapters The second part explains currently available active illumination techniques covering many techniques developed by the authors The final part shows how such active illumination techniques can be applied to various domains describing the issue to be overcome by active illumination techniques and the advantages of using these techniques This book is primarily aimed at 4th year undergraduate and 1st year graduate students and will also help engineers from fields beyond computer vision to use active illumination techniques Additionally the book is suitable as course material for technical seminars
