Transfer On Trial:

Transfer on Trial Douglas K. Detterman, Robert J. Sternberg, 1993 The importance of transfer for understanding intelligence cognition and education has been debated for a century as it has been one of the central theoretical issues in psychology education and cognition Education theories are based on the assumption that students will transfer what they learn in school to new situations But what if transfer does not occur Much of current educational practice could be called into question This book presents views on the status of transfer research Detterman argues that there is little evidence to support the existence of the transfer of complex skills such as those usually taught in school Contributors Earl C Butterfield and James G Greeno argue that transfer not only exists but that it is fundamental to complex cognitive performance Other contributors take intermediate positions presenting a review of transfer studies in applied domains These authors explore the situations in which transfer can or cannot occur

Cox, Andrea Benucci, R. Clay Reid, 2015-11-18
Vision is the process of extracting behaviorally relevant information from patterns of light that fall on retina as the eyes

sample the outside world Traditionally nonhuman primates macaque monkeys in particular have been viewed by many as the animal model of choice for investigating the neuronal substrates of visual processing not only because their visual systems closely mirror our own but also because it is often assumed that simpler brains lack advanced visual processing machinery However this narrow view of visual neuroscience ignores the fact that vision is widely distributed throughout the animal kingdom enabling a wide repertoire of complex behaviors in species from insects to birds fish and mammals Recent years have seen a resurgence of interest in alternative animal models for vision research especially rodents This resurgence is partly due to the availability of increasingly powerful experimental approaches e g optogenetics and two photon imaging that are challenging to apply to their full potential in primates Meanwhile even more phylogenetically distant species such as birds fish and insects have long been workhorse animal models for gaining insight into the core computations underlying visual processing In many cases these animal models are valuable precisely because their visual systems are simpler than the primate visual system Simpler systems are often easier to understand and studying a diversity of neuronal systems that achieve similar functions can focus attention on those computational principles that are universal and essential This Research Topic provides a survey of the state of the art in the use of animal models of visual functions that are alternative to macaques It includes original research methods articles reviews and opinions that exploit a variety of animal models including rodents birds fishes and insects as well as small New World monkey the marmoset to investigate visual function The experimental approaches covered by these studies range from psychophysics and electrophysiology to histology and genetics testifying to the richness and depth of visual neuroscience in non macaque species
