Certain Power Management Algorithms for Wireless Sensor Networks by Energy Efficient Data Transmission, Security and Node Deployment Linoy A Tharakan, 2018-02-12 Doctoral Thesis Dissertation from the year 2017 in the subject Electrotechnology grade PhD course Doctor of Philosophy language English abstract Wireless Sensor Networks WSNs is fast emerging as prominent study area that attracting considerable research attention globally The field has seen tremendous development in design and development of application related interfaces with sensor networks Sensor network finds applications in several domains such as medical military home networks space and so on Many researchers strongly believe that WSNs can become as important as the internet in the near future Just as the internet allows access to digital information anywhere WSNs could easily provide remote interaction with the physical world It is going to be the backbone of Ubiquitous Computing UBICOMP Through local collaboration among sensors elimination of duplicate data participation of relevant nodes in the given task etc can produce a significant difference in energy conservation thereby increasing the life time of the sensor network As the number of nodes increases data security becomes the most challenging part of the network The intruders can hack the data any time during processing transmission or at the receiver end So as a popular approach data encryption is the most commendable approach in today s network Asymmetric key encryption consumes more energy in processing and so not recommended for WSNs Symmetric key encryption gives better performance with respect to asymmetric key encryption in WSN applications It uses less computational power due to relatively effortless

mathematical operations and eventually spends less power This thesis also proposes a symmetric data encryption through Tabulation method of Boolean function reduction for the WSNs for secure data transmission It also suggests a new secure approach SEEMd Security Enabled Energy Efficient Middleware algorithm for the critical data sensing and gives a second chance to the nodes before it falls into to sleep mode for energy management WSNs are designed for applications which range from small size healthcare surveillance systems to large scale agricultural monitoring or environmental monitoring Thus any WSN deployment data aggregation processing and communication have to assure minimum Quality of Service QoS in the network from application to application In this circumstances the proposed algorithms in this thesis proved to be efficient and reliable in energy saving and life time enhancement
