Biomag 96 Cheryl J. Aine,Yoshio Okada,Gerhard Stroink,Stephen J. Swithenby,Charles C. Wood,2013-11-11 A modified Linear Estimation Approach was performed to reconstruct current sources within the heart Based on MRI data sets the Boundary Element Method was used to create tailored multicompartment models of the human thorax which were used to solve the forward problem of magnetocardiography The ability of the proposed method was demonstrated for the localization of a single current dipole as an example of a focal source By means of introducing small shiftings to all reconstruction dipoles during linear estimation solution as well as performing a successive focussing strategy ignoring places without significant electrical activity the method could easily be extended to the reconstruction of real 3D sources Based on a special minimum norm solution the source volume can be estimated applying a finite element approximation using cube elements The size of an extended current source can be estimated by superimposing the reconstructed dipoles to an equivalent dipole and comparing the corresponding volume with the sphere which would be related to the equivalent dipole The deviation of these volumes can be taken as a criterion for non dipolarity of sources

The Theory of Timed I/O Automata Dilsun K. Kaynar,Nancy Lynch,Roberto Segala,Frits Vaandrager,2022-12-06 This monograph presents the timed input output automaton TIOA modeling framework a basic mathematical framework to support description and analysis of timed computing systems Timed systems are systems in which desirable correctness or performance properties of the system depend on the timing of events not just on the order of their occurrence Timed systems are employed in a wide range of domains including communications embedded systems real time operating systems and automated control Many

applications involving timed systems have strong safety reliability and predictability requirements which makes it important to have methods for systematic design of systems and rigorous analysis of timing dependent behavior An important feature of the TIOA framework is its support for decomposing timed system descriptions In particular the framework includes a notion of external behavior for a TIOA which captures its discrete interactions with its environment The framework also defines what it means for one TIOA to implement another based on an inclusion relationship between their external behavior sets and defines notions of simulations which provide sufficient conditions for demonstrating implementation relationships The framework includes a composition operation for TIOAs which respects external behavior and a notion of receptiveness which implies that a TIOA does not block the passage of time
